Installation instructions

Download, install and check your setup in three clear stages.

01 / DOWNLOAD & PREPARE

Start with the latest Sufa Installer

RE-DOWNLOAD THE SUFA INSTALLER

Download the **Sufa Installer** again from the DCMii Discord download channel before getting V3.2.0. **Older versions cannot download this release.**

Use the current **Sufa Installer** from **#mod-download** to obtain the V3.2.0 packages. This release uses two ZIP archives with different destinations.

MAIN MOD

V3.2.0 DCMii-Project F-16 Sufa Main.zip

Contains five DCMii mod-package folders. Extract them into your OvGME repository, then enable them through your DCS root profile.

LIVERIES

V3.2.0 DCMii-Project F-16 Liveries.zip

Contains the folders F-16C_50 and F-16D_50 directly. Copy these to Saved Games\DCS\Liveries after extraction.

BEFORE YOU REPLACE ANYTHING

1. Close DCS World.
2. If updating, disable the old DCMii packages in OvGME first.
3. Back up any personal edits or custom liveries you want to keep.
4. Extract both ZIPs to a temporary folder so their contents are easy to inspect.

Two locations, two jobs: OvGME manages the main mod in your DCS installation. Liveries go into your personal Saved Games folder.

Install the main mod

Main ZIP > OvGME repository > DCS World installation

01 Extract the five DCMii folders

Open the extracted main archive. Keep the aircraft, sounds, targeting pod, AGM-154B and Python-5 packages as separate folders. Preserve their original names.

02 Place them in your OvGME repository

Use the repository configured in your OvGME profile. The path below is an example; your repository may be elsewhere.

```
C:\Users\YourUsername\Documents\DCS-Mods
```

DCS-Mods OvGME repository example

- DCMii-Project-Advanced Targeting Pod ...
- DCMii-Project-AGM-154B
- DCMii-Project-F-16I Sufa PW-229 Sounds
- DCMii-Project-F-16I_Sufa
- DCMii-Project-Python-5

Five separate package folders, directly inside your repository. The targeting-pod name is abbreviated above; keep the full name supplied in the archive.

03 Check for an extra wrapper folder

Opening **DCMii-Project-F-16I_Sufa** should immediately show its installation directories, such as **CoreMods**, **Mods** and **Scripts**. It must not contain another copy of the same package folder.

04 Enable the packages in OvGME

Select the profile whose root folder points to your **DCS World installation**. Enable the supplied DCMii packages for the full installation. Keep DCS closed until OvGME has finished.

Updating: after disabling the old packages, replace their repository copies with the new ones. Keep unrelated mods. Do not manually copy these packages into DCS or install them under Saved Games.

Add liveries & check

Livery ZIP > Saved Games > DCS > Liveries

01 Extract the livery ZIP once

V3.2.0 contains **F-16C_50** and **F-16D_50** as folders, not inner ZIP files. No second ZIP extraction is needed.

02 Copy both aircraft folders into Liveries

Use your active DCS Saved Games folder. Create **Liveries** if needed. Merge the matching aircraft folders and replace older supplied files when prompted, after backing up personal changes.

DESTINATION EXAMPLE

```
C:\Users\YourUsername\Saved Games\DCS\Liveries
```

FINAL FOLDER LAYOUT

```
Liveries\
  F-16C_50\
    [individual single-seat livery folders]\
  F-16D_50\
    [individual dual-seat livery folders]\
```

Use your Windows username. If your active Saved Games profile uses a different DCS folder name, use that folder instead.

03 Start DCS and verify your installation

Check that the aircraft is available, select a matching livery and open a simple test mission. Confirm the main packages are enabled and the livery appears as expected.

QUICK FIXES

Download will not start	Re-download the Sufa Installer from Discord; older versions cannot download this release.
OvGME does not list a package	Check the configured repository and remove any extra outer folder.
A livery is missing	Check the active Saved Games path and aircraft folder. Avoid F-16D_50\F-16D_50 or F-16C_50\F-16C_50 nesting.
