Beginner's guide

A friendly introduction to the F-16 Sufa Mod, cockpits and two-seat flying.

DCMii F-16 formation / In-game screenshot

WELCOME / PROJECT OVERVIEW

Meet the Sufa family.

Digital Combat Mod Integration Intelligence (DCMii) is the team behind the unofficial **F-16 Sufa Mod** for DCS World. The project expands the F-16CM, F-16D / Barak and F-16I Sufa families with additional aircraft configurations, cockpit equipment and a cooperative pilot/WSO experience.

FLY SOLO

Choose a single-seater or fly a dual-seater by yourself and switch cockpits with **0 / 9**.

FLY AS A CREW

Join a compatible server with a friend; pilot and WSO share many aircraft systems and use **R** for control handover.

WHERE TO BEGIN

For downloads, exact folders and OvGME setup, use the separate **V4.0.0 Installation Instructions**. This guide focuses on what the aircraft can do and how to fly it.

Choose your aircraft

Learn the F-16 variants before loading your first mission.

01 / AIRCRAFT MODELS

Single seat and two-seat families.

F-16CM / SINGLE SEAT

Modern single-seat F-16 variants with optional weapons, CFT configurations and the integrated **Center Pedestal Display (CPD)**.

F-16D / BARAK

Dual-seat variants spanning **Block 30 / 40 / 50 / 52** choices and applicable **NS (no-spine)** versions. Two crew positions for multiplayer.

F-16I SUFA / TWO SEATS

Israeli-inspired two-seat aircraft with its own Sufa cockpit treatment, CFT-equipped configurations, distinctive RWR and the full DCMii two-crew experience.

02 / TERMINOLOGY

A few names you will see in DCS.

Block 30/40/50/52	F-16 variant families; choose the specific aircraft configuration available in the mission.
Barak / Sufa	Names used for different F-16D and F-16I aircraft configurations.
NS / no-spine	Variant without the enlarged dorsal spine, where that model is offered.
CFT	Conformal Fuel Tanks fitted close to the aircraft body; select compatible loadouts.
WSO	Weapon Systems Officer: the crew member in the rear cockpit.

Explore the features

Weapons, cockpit upgrades, visuals and optional extras.

03 / MODULAR EQUIPMENT

Install only the components you need.

The Main Package includes six separate DCS-root folders. Only the **F-16I_Sufa aircraft** and **PW-229 Sounds** are needed for the core setup. The other four folders are optional and can be enabled or disabled separately through OvGME.

OPTIONAL WEAPONS

Python-5, **AGM-154B** and **SPICE 2000** are each their own packages. Use compatible loadouts and weapon options.

OPTIONAL TGP

The custom **AN/AAQ-33** targeting pod is another independent package. Its cursor/lock is not synchronized across two PCs.

04 / MORE ADDITIONS

Not just two extra seats.

- **Center Pedestal Display:** CPD addition for the supported single-seat aircraft, based on Kaiqi / Pobit work.
- **Internal ECM jammer:** selectable in the aircraft loadout on compatible models; this is an equipment option, not multicrew ECM-state sync.
- **CFTs & external tanks:** additional supported fuel and station configurations; not every mix is valid.
- **Liveries:** optional Israeli, Bulgarian, Hellenic and Moroccan-inspired paint schemes for supported single- and dual-seat aircraft.
- **HUD/HMD rework:** graphical improvements across dual-seat models, with an optional sharper-line setting.

> **COMPANION DOCUMENT**
>
> For the exhaustive, system-by-system inventory, open the separate **V4.0.0 Feature Reference** PDF.

Fly with a second player

How the pilot and WSO share control in multiplayer.

05 / MULTIPLAYER BASICS

Two people. One aircraft.

Both players need the matching V4.0.0 client installation and a multiplayer server that supports DCMii. Join the front pilot slot and rear WSO slot of the same two-seat aircraft. You both remain in those seats for the flight.

R / REQUEST CONTROL

In multiplayer, press **R** to request flight control from the other crew member. This changes **who is flying** - not where either player sits.

0 / 9 / SINGLEPLAYER

When flying alone in a two-seat aircraft, use **0** and **9** to switch between the two cockpits. Do not use these keys for MP control transfer.

06 / CREW COORDINATION

Do not duplicate every control action.

- **Shared flight systems:** throttle setting and indications, fuel-flow/level coordination, speedbrakes and landing gear follow the active flight controls.
- **Shared mission systems:** Master Arm, Laser Arm, NWS, flight modes, DED/waypoints and Stores Configuration are coordinated between seats.
- **Shared canopy and startup:** canopy, yellow handle and cold-start switches work as a two-crew workflow.
- **After Request Control:** smoothly match your physical throttle to the active setting to avoid surprises.

> **GROUND CREW / IMPORTANT**
>
> At **every rearm or refuel**, the pilot **and** WSO must each contact the ground crew and complete the service on their own client. Doing it from one cockpit only can cause fuel/store synchronization problems.

Cold start as a crew

The synchronized startup - and one INS step you must finish manually.

07 / COLD AND DARK

Both cockpits wake up together.

01

Electrical power

MAIN PWR, avionics master, weapon power and sensor-related switches are shared between both crew positions.

02

Start the engine

The JFS starter and OFF-to-IDLE startup sequence are coordinated. RPM, fuel flow, engine-related sound and nozzle indication are part of the synchronized experience.

03

Align the INS

The INS mode selector synchronizes, and both clients align their INS **at the same time**. Watch the DED INS page and wait for the readiness indication.

04

Return to the normal DED page

After INS alignment, press RTN (Return) manually to leave the INS page. The INS page does not close automatically. Continue the normal startup/flight checks.

05

Finish before taxi

IFF Master, RWR Power and other supported common switches can be coordinated. Use R for control handover as needed.

NOTE ON INS

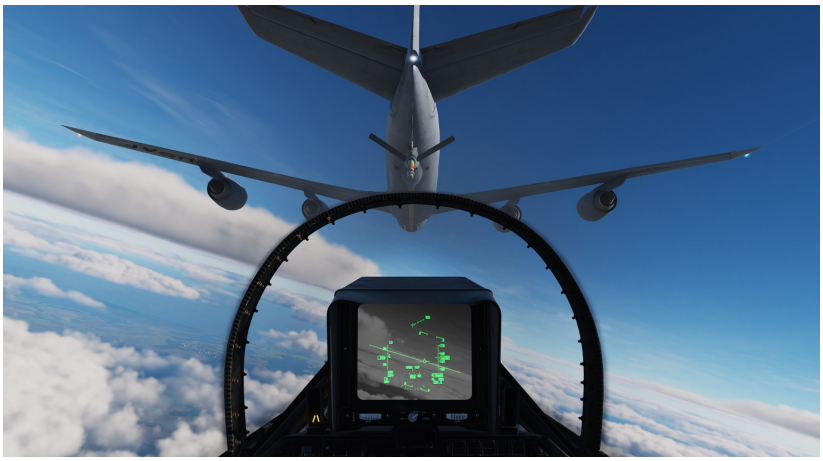

The INS switches and alignment workflow are synchronized, but both DCS clients still run their own underlying native alignment process. Check both sides are ready before departure.

Inside the cockpit

The Sufa display, rear HUD camera and remaining limitations.

08 / VISUAL HIGHLIGHTS

What you will notice in the aircraft.

Rear-seat HUD repeater / In-game view

F-16I RWR

The **F-16I Sufa** has a Sufa-style blue-ring RWR, central dot, threat lock line, small Flare/Chaff counter and PWR OFF indication. The HUD/HMD rework applies to all dual-seaters. The rear grayscale live HUD-repeater camera is available on the supported dual-seaters **except Barak Block 30**.

09 / COMMON QUESTIONS

What is not fully shared?

SMS counter	The native SMS weapon counter is not synchronized across pilot/WSO clients.
TGP / FCR	Cursor direction and target lock remain local to each client.
ECM / CMDS	The optional internal ECM jammer is selectable on compatible aircraft, but this is not a claim of full CMDS or ECM synchronization.
Server support	Choose a DCMii-compatible server. Integrity Check may reject modified aircraft packages on other servers.
