What's new in 4.0.0

F-16 Sufa Mod by DCMii: shared startup, shared flight and a distinct Sufa cockpit.

01
Multicrew
Pilot + WSO

02
Full cold start
Shared sequence

03
Flight handover
R request control

01 / MULTICREW FOUNDATION

A substantial systems upgrade.

V4.0.0 introduces a working pilot/WSO multicrew architecture for the F-16D and F-16I families. Instead of sharing only visual switch positions, the release coordinates cockpit actions, flight ownership and essential aircraft systems across both players.

Two-way cockpit interaction

The pilot and WSO can operate a broad set of shared systems. Many mode and avionics actions work from either seat without taking the flight controls. The synchronized cold-start sequence has been tested in multiplayer.

Request Control with R

Press **R** in multiplayer to request flight-control ownership. The system transfers control between front and rear crew positions while both players remain in their respective seats. The handover covers critical gear, throttle and speedbrake behavior.

Native communication, crew matching and robustness

The mod uses a DCS-native crew RPC channel with session, peer and message checks. An updated 16-switch crew message block supports the RWR Power switch. Both clients need the matching release.

Cold & dark to takeoff

Shared MAIN PWR, JFS, engine-start IDLE action, avionics/weapon power, INS mode, IFF Master and RWR Power let both crew members participate in a startup from a cold aircraft.

> **IMPORTANT**
>
> The public release number is **V4.0.0**. Internal builds used for development and testing do not change the public release name. The F-16 Sufa Mod remains an unofficial DCS World community project.

Multicrew systems

A closer look at the synchronized functions.

02 / COMPLETE SYNCHRONIZATION

Shared from pilot to WSO and back.

Power & startup	Main Power, JFS starter, OFF-to-IDLE transition, avionics master switches, weapon and sensor power, IFF Master and RWR Power.
INS / navigation	Coordinated INS-mode switching and concurrent alignment on both clients; DED/waypoints and supported steerpoint changes. After INS alignment, exit the INS DED page manually using **RTN**.
Flight controls	Throttle follow, fuel flow and fuel-level coordination, speedbrakes, landing gear/handle and gear behavior across Request Control.
Engine readouts	RPM and fuel-flow indications, engine-related audio and nozzle-position indication are part of the shared experience.
Mission systems	Master Arm, Laser Arm, NWS, A-A/A-G/Dogfight flight modes, Stores Configuration, and crew input without Request Control where supported.
Canopy & safety	Canopy position, yellow canopy handle and coordinated closure. Canopy jettison and ejection-seat actions remain supported.

03 / OPERATIONS

Two practical things to know.

MULTIPLAYER

R requests flight control; it does not switch the physical seat. Modes can be changed without ownership where supported.

SINGLEPLAYER

Use **0 / 9** to switch between the front and rear cockpit in dual-seat variants.

REARM / REFUEL

For a multiplayer rearm or refuel, **both pilot and WSO must individually request and complete the service** on their own client, or the simulated fuel/loadout states may diverge.

Aircraft & visual upgrades

Model families, cockpit details, optional packs and compatibility.

04 / AIRCRAFT LINEUP

F-16CM, F-16D / Barak and F-16I.

The DCMii family includes single-seat F-16CM options and two-seat **F-16D / Barak** and **F-16I Sufa** aircraft. The two-seat family covers **Block 30, 40, 50 and 52** options, including applicable **NS (no-spine)** variants. Exact names depend on the variant selected in DCS.

05 / DISTINCTIVE COCKPITS

Sufa RWR, HUD and HMD.

In-game Sufa RWR

F-16I RWR: a Sufa-style blue ring and center dot, corrected lock line, compact Flare/Chaff counter and PWR OFF indication. The DED CNI labels use **GRN / RED**.

All dual-seat aircraft: HUD and HMD rework; optional sharper lines. A grayscale live HUD-repeater camera is available in the rear cockpit **except on the Barak Block 30**.

06 / EQUIPMENT & COMPATIBILITY

A modular main download.

- **Core:** F-16I_Sufa aircraft and PW-229 Sounds packages.
- **Independently optional:** AN/AAQ-33 custom TGP, AGM-154B, Python-5 and SPICE 2000.
- **Other options:** supported CFTs/external tanks, internal ECM jammer selectable in compatible aircraft loadouts, and the single-seat CPD.
- **Cleaner setup:** removed unused weapons-package dofile entries, reduced redundant diagnostics; separate dedicated-server edition available.
