Installation instructions

Official V4.0.0 folder layout - main mod, crew scripts and optional liveries.

01 / DOWNLOAD

Two ZIP downloads in the Sufa Installer.

Open the latest **Sufa Installer** from the DCMii Discord download channel. It retrieves the current release from Cloudflare R2. The Main Package is required; the liveries are optional.

REQUIRED / MAIN

V4.0.0 DCMii-Project F-16 Sufa Main.zip
Includes **DCS_ROOT.zip** and **SAVED_GAMES.zip**.

Two destinations

OPTIONAL / LIVERIES

V4.0.0 DCMii-Project F-16 Liveries.zip
Includes the top-level **Liveries** folder.

Saved Games destination

02 / UNDERSTAND THE ARCHIVES

The extra ZIP level matters.

```
V4.0.0 ... Sufa Main.zip
    DCS_ROOT.zip
        six independent OvGME packages
    SAVED_GAMES.zip
        Scripts/
V4.0.0 ... F-16 Liveries.zip
    Liveries/
        F-16C_50/ + F-16D_50/
```

BEFORE REPLACING FILES

Close DCS, disable the old DCMii packages in OvGME and back up personal edits. Extract the nested ZIPs before copying anything; do not drop the outer Main ZIP into DCS.

Install the DCS packages

DCS_ROOT.zip contains six separate OvGME folders.

03 / DCS WORLD ROOT

Extract into your OvGME repository.

Extract **DCS_ROOT.zip** from the Main Package. Put all six mod folders side by side in the folder your OvGME DCS-root profile uses. Do not merge them together.

```
DCS-Mods/    (example OvGME repository)
    DCMii-Project-F-16I_Sufa
    DCMii-Project-F-16I Sufa PW-229 Sounds
    DCMii-Project-Advanced Targeting ...
    DCMii-Project-AGM-154B
    DCMii-Project-Python-5
    DCMii-Project-Spice_2000
```

WHAT YOU ACTUALLY NEED

Enable **F-16I_Sufa** and **PW-229 Sounds** for the core installation. The custom TGP, AGM-154B, Python-5 and SPICE 2000 are **independent optional OvGME packages**. Install/enable only those you want.

04 / ACTIVATE

Keep every package separate.

01

Check the folder nesting

Opening the DCMii aircraft folder should show DCS installation directories such as Mods, CoreMods and Scripts - not another copy of the same folder.

02

Choose your optional additions

Advanced Targeting Pod, AGM-154B, Python-5 and SPICE 2000 can each be enabled or disabled independently. Some weapon or CFT combinations have restrictions.

03

Enable through the DCS-root profile

Enable the selected packages in OvGME while DCS is closed. Do not copy the OvGME repository folders directly into Saved Games.

Saved Games & liveries

Keep the crew scripts separate from the DCS-root mod packages.

05 / CREW SCRIPTS

Extract SAVED_GAMES.zip.

The Main Package also contains **SAVED_GAMES.zip**. Extract it and merge its top-level **Scripts** folder into your active DCS Saved Games profile. These scripts are needed for the multicrew communication setup.

```
C:/Users/YourUsername/Saved Games/DCS/
    Scripts/   <-- from SAVED_GAMES.zip
```

> **USE THE RIGHT SAVED GAMES PROFILE**
>
> If you use a profile such as **DCS.openbeta** or a custom server profile, select the folder your actual DCS client is using. Avoid accidentally creating Scripts/Scripts.

06 / LIVERIES (OPTIONAL)

A different top-level folder.

Extract the separately downloaded Liveries ZIP. It contains a **Liveries** folder, which must be merged into the active Saved Games profile. This is not an OvGME package.

```
Saved Games/DCS/
    Liveries/
        F-16C_50/
            [single-seat livery folders]
        F-16D_50/
            [dual-seat livery folders]
```

The livery pack includes available Israeli, Bulgarian, Hellenic and Moroccan-themed paint schemes. Choose skins for the corresponding aircraft variant.

Verify & troubleshoot

A short check before your first flight or multiplayer sortie.

07 / FINAL CHECKS

Make sure the release is ready.

01

Start DCS and choose an aircraft

Check the aircraft list for F-16CM, F-16D / Barak or F-16I Sufa variants. Test a compatible livery and start a simple mission.

02

Try the two crew controls

In a dual-seater: **0 / 9** switches seats in singleplayer; **R** requests flight control in multiplayer. Multiplayer seats do not swap.

03

Use identical client versions

Both pilot and WSO need compatible V4.0.0 files, including the correct Saved Games Scripts. The multiplayer server also needs to support DCMii.

IMPORTANT / REARM & REFUEL IN MULTICREW

When you rearm or refuel, **both the pilot and WSO must each request and complete the ground-crew service on their own client**. If only one player does it, local fuel/store states can differ and synchronization issues may follow.

QUICK TROUBLESHOOTING

Common installation mistakes

OvGME package missing	Check the repository profile and remove extra nested wrapper folders.
No multicrew sync	Check both clients use the same build and Saved Games Scripts.
Liveries missing	Check your active Saved Games folder and avoid Liveries/Liveries nesting.
Integrity Check	Some multiplayer servers reject DCS-root modifications; use compatible servers.
